Note: Our technicians will store privately owned straws for breeders. While every care and precaution will be taken with privately owned straws, Progressive Genetics or our Technicians can not be held responsible for any loss or damage to these straws.

Dear Pedigree Breeder,

Welcome to our new Prestige Charolais catalogue. The Prestige Selection is a new range of elite bulls which we at Progressive Genetics have chosen for you, the pedigree breeder. These sires have been carefully selected & represent the best Charolais genetics available globally.

The Progressive Genetics team are always available to provide professional advice to enable you to achieve the breeding goals for your herd.

Please note many of the sires featured are 'pre-order' & will not be carried by your A.I. technician, these sires should be pre-ordered from Progressive Genetics at least three weeks before the semen will be needed. You can call your local representative, order on-line from progressivegenetics.ie or call the office.

The bulls labelled with a 'pedigree royalty' sticker are in the Charolais Society royalty scheme; a royalty is payable on all pedigree progeny registered from these sires in their herdbook.

Cloondratoon Ricky

- Ricky is a very exciting young bull with many of the traits of his sire Fiston.
- Ricky has matured into an impressive powerful, long bull with excellent muscle both on top and on the hindquarter
- Ricky was the top priced bull at the Premier Sale in Elphin March 2021

Fiston FSZ

Noticeable effects

muscling may result in increased birth weights & reduced calving ability of females.

A Myostatin genotype is a further item of information that will help you achieve your breeding goals, when used in conjunction with the index, knowledge of the pedigree & visual assessment.

The status of our sires is available in the catalogue & online. In line with our policy of providing all of the information we have available on our sires, we have printed the Myostatin status of all of our bulls in our beef catalogues for the past year.

The status of your females can be ascertained through genotyping. Knowing the status of both parents helps you, the breeder, to tailor the desired outcome of a mating to your preference.

Help your AI technician, do the job for you!

Proper Restraint

Proper placement of the semen is one of the main factors influencing success rate. Placement is a very specific procedure, it is crucial that the cow is properly restrained to maximise success. Proper restraint means that side to side, forward & backward movement are minimized. Concentration is required for precision, please avoid speaking with the technician as the insemination is being carried out.

Safety

To ensure adequate restraint & the comfort & safety of man & beast, the crush should have a non-slip floor.

Avoid penning a suckler cow/heifer on her own for AI as she may become stressed & difficult to handle & inseminate.

Timing Of AI

The best time to inseminate a cow is when she is in standing heat & up to twelve hours later. If it is longer than twelve hours after the end of standing heat the results from A.I. will be reduced.

The Myostatin (MH) gene is a recessive gene found in all mammals & influences the production of a protein that controls muscle development. Natural mutations cause a deletion in the bovine myostatin so the muscles keep growing, resulting in the double-musled phenotype.

Effects Of Myostatin

The carcasses of double-musled cattle kill out up to 19% higher than cattle that don't exhibit double muscling. This is due to a combination of increased muscle mass, reduced body fat, reduced bone mass & smaller internal organs. When muscle weight gain per unit energy intake is taken in to account, double-musled cattle have better feed efficiency. Meat from double-musled cattle tends to be of better quality due to a combination of increased tenderness, reduced fat content & a higher proportion of polyunsaturated fats.

The presence of Myostatin mutations has a beneficial effect on the carcass traits. However, difficulties may occur when carriers of the six disruptive MH variants are mated to each other leading to the potential for calving difficulty as a result of increased birth weight/compromised calving ability. This however can be avoided through knowledge of the status of both the male & the female in the mating.

Variants

Variant F94L, sometimes called 'the profit gene' has a high frequency in Limousin cattle; many have two copies i.e. are homozygous. This variant has been found to increase the size of muscle fibres with no associated increase in calving difficulty, or lowered fertility or longevity (non-disruptive).

Variant nt821 is commonly found in the Belgian Blue & Parthenaise breeds with lower frequency occurring in the Limousin, Shorthorn & Angus breeds. Homozygous animals exhibit: greater loin depths, large rounded rump & thighs, reduced fat cover & greater meat tenderness. However, unlike F94L, homozygous animals may also have slightly heavier birth weights & compromised calving ability in the females. Heterozygous animals (nt821/+) exhibit the above characteristics albeit to a lesser extent.

Variant Q204X is commonly found in the Charolais breed & with lower frequency in the Limousin breed. Homozygous animals exhibit: greater loin depths, large rounded rump & thighs, reduced fat cover & greater meat tenderness. However, they may also have heavier birth weights & slightly reduced milking ability & calving ability in females. Heterozygous animals (Q204X/+) exhibit the above characteristics albeit to a lesser extent.

Recommendations

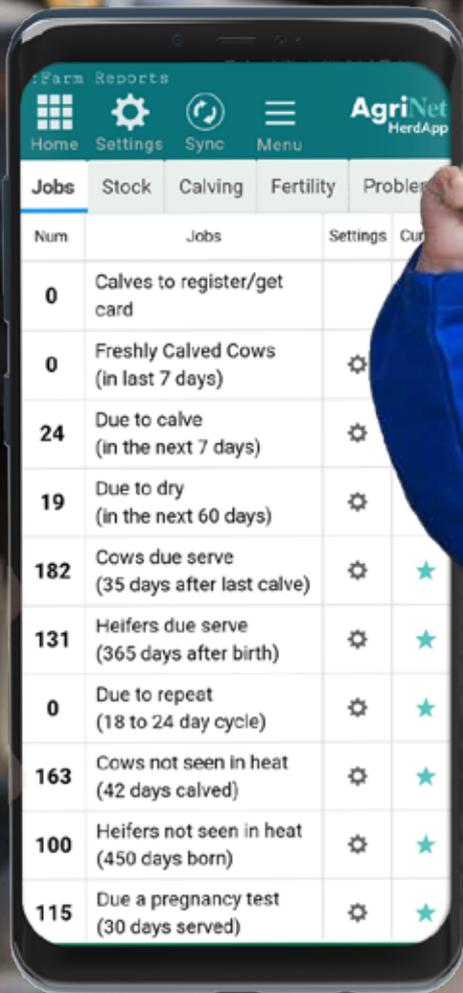

Genotype all of your females. The myostatin status can be ascertained by Weatherbys once the genotype has been done.

If you want a MH-free herd (+/+), eliminate the carrier breeding females & use non-carrier sires only.

If you want to reap the improved carcass benefits of MH+ animals whilst limiting the negative aspects, then work with heterozygous animals e.g. (nt821/+), (Q204X/+). Do not mate heterozygous males with heterozygous females. Mate noncarrier females with heterozygous/homozygous bulls. Continue to genotype both breeding females & males to establish the MH status pre-breeding. In addition, assess calving ability of the female using visual assessment & the daughter calving index.

If you want to breed animals with extreme muscling use homozygous bulls with heterozygous/homozygous females. Beware that the extra
