Catalogue Symbols Guide

Test Sire

New test sire available, low reliability for calving and no field fertility.

New

New sires available.

Hetropolled

Hetrozygous Polled
Resulting offspring have a 50% chance of horns.

Homopolled

Homozygous Polled
Resulting offspring will have no horns.

Red Carrier

Selected sires that carry the red gene coat colour.

Weanling

Sires that produce high value weanlings with excellent weight & muscle development at weaning stage.

Pedigree Royalty

A royalty fee applies to these sires when registering pedigree progeny. This is collected by the relevant breed society. No fee applies to commercial calves.

PRE-ORDER

Pre-Ordered Sires
Due to increased lead time for delivery.

Proof Pending

Awaiting Proofs.

Sexed Female

Available Sexed Female.

Finishing

Sires identified to produce heavy, high grade & high value carcasses.

Sexed Male

Available Sexed Male.

Our technicians will store privately owned straws for breeders. While every care and precaution will be taken with privately owned straws, Progressive Genetics or our Technicians can not be held responsible for any loss or damage to these straws.

Front Cover Image: Photographer Alfie Shaw.

Image: Paul Keating, New Ross, Co. Wexford.

Progressive Genetics are committed to excellent semen quality and good on-farm fertility results. Progressive Genetics will not be held responsible for the actual fertility achieved from the use of its products.

Corney Valentines, Corbaun Rory CH8334, David Magee.

Overall Commercial Champion at Clonmaney Show

Patissier De La Grande Rose (PPS) daughter, Cian McGloin.

The Benefits of Synchronisation

1. All animals inseminated on the one day without any heat detection.
2. Repeats will occur over a 2-4 day period, making heat detection much easier as more animals are on heat at the one time. You will know the expected days of heats in advance.
3. Cows calved 35 days and not cycling when synchronised will resume cyclicity, provided nutrition and management is good. This will increase the 3 and 6 week calving rate.

4. A compact group of cows/heifers can be presented for scanning and the empty cows/heifers can be synchronised again or marked for heat detection.
5. A compact calf crop makes management from calving to weaning easier and facilitates sale.
6. Compacting calving allows animals to be grouped together e.g. all 1st calvers can be grouped together for extra feeding.
7. Even though you will inseminate animals in one day, they will calve over a two-week period.

REMEMBER!

When heats are due in a group of cows indoors, it is best to lock the calves away from the cows in the creep area to avoid them getting injured. It is also prudent to take away the vasectomised bull at this time of maximum activity to avoid him getting injured.

Beef Cows - Synchronisation for Cows fixed time AI at a Pre-Determined time No Heat Detection - 3 Handlings in the crush

Monday 1st	Day 0	AM	Insert PRID or CIDR* and inject GnRH
Monday 8th	Day 7	AM	Inject PG & eCG & Remove PRID/ CIDR*
Thursday 11th	Day 10	AM to noon	AI all cows and inject GnRH (72 hours after PG injection)

This is a superb programme for herds that wish to tighten and advance the mean calving date & maximises pregnancy rates as 100% submission is achieved. Superb to bring forward late calvers, however ensure cows are calved 35 days, have a BCS of 2.75+ and Intakes are maximised.

Beef Heifers - Cost Effective Regime & High Conception Rates AI at Observed Heat - 12 Day Heat Detection

Monday 1st	Day 0 - Day 7	AI on observed heat - should have 1/3 detected at end of week.
Monday 8th	Day 8	PG to heifers not detected in heat. Only inject if 1/3 bred already - otherwise investigate
Wednesday 10th / Thursday 11th	Day 10 - Day 11	AI on detected heat. Majority on 48-72 hours post PG injection

If 1/3 are not bred in the 1st week avoid injecting with PG as the heifers are not cycling- due to their weight, plane of nutrition, pregnancy or heat detection. For those that are not observed- reinject PG 11 days after the 1st injection. If releasing a bull after AI, watch carefully for the repeats to ensure he is not overworked in those 2-4 days- prudent to use AI for those 2-4 days.

Beef Heifers - Synchronisation - fixed time AI at a Pre-Determined time No Heat Detection - 4 Handlings in the crush

Monday 1st	Day 0	AM or PM	Insert PRID or CIDR* & Inject GnRH
Saturday 6th	Day 5	AM or PM	Inject PG
Sunday 7th	Day 6	AM or PM	Inject PG and remove PRID or CIDR*
Tuesday 9th	Day 8	AM or PM	Inject GnRH and fixed timed AI (72 hours after PG injection)

Decide at the beginning of the protocol whether it is AM or PM that is convenient for you and remain with it. Talk to your AI technician before commencing. This regime allows you to inseminate all heifers with 4 handlings and all are AI'd at a fixed time- No heat detection until the repeats. AI'ing the repeats ensures that the bulls are not overworked, avoids bulls getting injured and ensures we will have them when we need them.

PG Prostaglandin- *Estrumate, *Lutalyse, *Enzaprost.
GnRH- *Receptal, *Ovarelin.
ecG- *Folligon PMSG, *Synchrostim.

Inadvertent administration of prostaglandin to a cow/ heifer during the first 3-4 months of pregnancy will cause abortion.
*POM prescription only medicines and under veterinary control.

Maximise the success of AI in Suckler Cows

1. Cow must have an easy calving

Difficult calvings is one of the biggest causes of cows being slow to return to service.

2. Nutrition and BCS at calving

The higher the BCS at calving the quicker the cow will resume cycling post calving. A BCS of 2.5+ is ideal.

3. Requirements for cows to express normal heat activity

Adequate space is necessary to allow mounting for heat detection.

Increased stocking density indoors reduces heat expression and more false heats will occur.

4. Break the strong maternal- offspring bond

Cows must cycle within 55 days of calving to achieve one calf per cow per year.

Breaking the maternal bond will reduce the time to first heat by 4 weeks.

5. Avoid stress around the time of breeding

Avoid mixing cows from different groups during the breeding season especially 1st calved heifers.

6. Timing of insemination to maximise conception rates

The best time to inseminate is when animals are in standing heat and up to 12 hours after the end of standing heat.

7. Health

Ensure cows receive all vaccinations 3 weeks prior to breeding.

8. Biosecurity

It's everybody's responsibility!

Maximise the success of AI in Maiden Heifers

Recommended target weight at 14 months

Breed Target	Target (KG)	ADG birth to 14 months (Kg/day)
Angus X	370	0.77
Hereford X	370	0.77
Simmental X	400	0.85
Limousin X	420	0.88
Charolais X	430	0.9

Ensure that heifers meet the recommended target weights at breeding

This ensures

The majority of heifers are cycling

Heifers are well developed at calving & will calve easily

Heifers are more likely to go in-calf within

60-80 days after their 1st calving.
